

ABSTRACT OF THE DISCLOSUREDEVICE FOR EXAMINATION, SAMPLING, OR EXTRACTION AT A  
PRECISE POSITION UNDER A SLAB

5

A tool (7) for sampling or extracting the contents of a pit (4) is suspended from a cable (8) passing through a narrow opening (3) in a slab (2) covering the pit. A crosspiece (13) hooked to guide cables (11) which 10 converge on it makes it possible to displace the lifting cable (8) under the slab (2) according to different movements imposed by winches (10). Thus it is possible to move the tool (7) to the desired point with great precision and without having to descend into the 15 pit (4).
